

The Retractable Hose Central Vac System

Vacuuming Just Got Easier!
[Click here to view a video](#)

Finally... "the problem of what to do with the hose when you are finished vacuuming" ...has been solved!

With The Retractable Hose Central Vacuum System you simply pull out the amount of hose you need, connect the remote controlled handle, and begin vacuuming.

When you're finished, the suction from the central vacuum unit retracts the hose back out of sight.

The hose is stored inside the vacuum tubing hidden within the walls, attic, or crawl space.

Since you no longer need to store the hose in a closet, longer hoses can be used, thus reducing the number of inlets by half. One hose can cover up to 2300 sq. ft.

The hose sock remains cleaner with the Retractable Hose System, because each time the Power Unit is turned on the suction removes dirt and dust particles that the hose may have picked up from the floor while vacuuming

Why a Central Vacuum System?

House Dust Mite 350x

After vacuuming with most uprights, it's typical to smell odors and see dust particles reflected in the sunlight. Traditional vacuums spread these particles and allergens around your home and recirculate them into the air you breathe.

By placing the Power Unit outside your living area, Central Vacuum Systems eliminate these odors and dust particles for a cleaner home with cleaner air. In addition Central Vacuum Systems have up to five times the suction and power of portable vacuums.
